NetLine/Ops *OpsLink*

The comprehensive, web-based view on NetLine data

NetLine/Ops *OpsLink* creates value

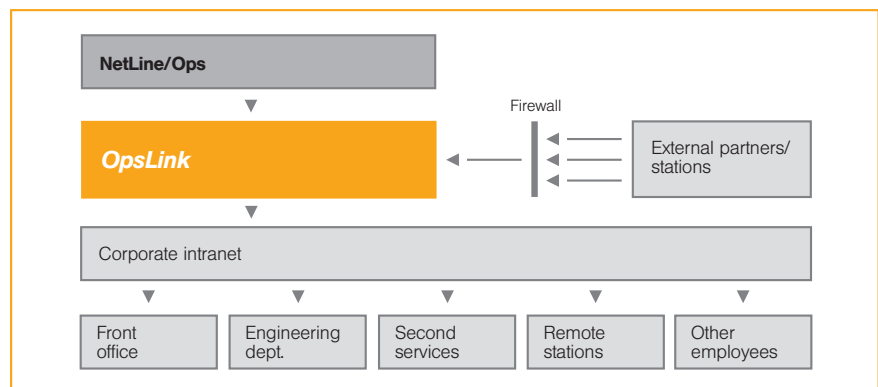

- Reduces hardware investment
- Cuts hardware maintenance costs
- Decreases communication costs

The basis of NetLine is a unified database covering all flight-related data. It forms the basis for the integrated, effective control of all airline operations.

The data material supplied by NetLine is valuable not only in terms of planning and controlling. It can be used to obtain information about the real-time status of operations at any time or to make evaluations of past time periods.

Up to now, this data has been accessible only via NetLine products such as NetLine/Ops or NetLine/Crew, or via direct, immediate access to the database. The web-based *OpsLink* now allows direct location-independent access to NetLine data.

More than 55 airlines worldwide rely on NetLine every day.

Features and functions

OpsLink provides secure, web-based access to the operational data in the NetLine database. On-site staff, external staff, and contracting companies all profit from this. All they need in order to view the required information is an Internet connection with a standard browser at the workstation in question.

OpsLink offers outstations to send MVT messages without the need for expensive telex equipment. MVT input can be in airport local time and is checked for consistency, improving telex quality and reducing communication costs.

OpsLink guarantees full access security by means of hierarchical access authorizations and differentiated issuing of authorization.

The statistics plug-in allows the inclusion of customer-specific statistics on the day-to-day performance of the airline.

Information provided by the NetLine database includes

- arrival/departure information
- leg lists and leg details
- aircraft and airport data
- check information
- configurable statistics

System requirements

- web Browser
- Internet or intranet access
- Oracle database with NetLine data
